DETAILED ACTION

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Nema Berezny - attorney for Applicants - on 25 March 2011.

2. The claims are amended as follows:

1. (Currently Amended) A computer-implemented method for processing data using a computer system having processor, memory, and data storage subsystems, the computer-implemented method comprising:

providing a mirror data structure to represent a first data structure;

supplying user input data to a plurality of parser analysis engines via snapshots of the mirror data structure;

operating on the snapshots by the plurality of parser analysis engines to form a second data structure, wherein the second data structure includes at least a first set of leaf nodes under a first ancestor node and a second set of leaf nodes under a second ancestor node;

identifying one or more potential candidate nodes for the first ancestor node via the processor based, at least in part, on a bottom-up hierarchical structured selection of ancestor nodes from the first data structure associated with the leaf nodes in the first set;

identifying one or more potential candidate nodes for the second ancestor node via the processor based, at least in part, on a bottom-up hierarchical structured selection of ancestor nodes from the first data structure associated with the leaf nodes in the second set;

assigning the first ancestor node based on a top-down hierarchical structured selection of the potential candidate node most often identified as associated with the leaf nodes in the first set; and

assigning the second ancestor node based on a top-down hierarchical structured selection of one or more criteria other than the potential candidate node most often identified as associated with the leaf nodes in the second set.

6. (Currently Amended) A computer-implemented method for processing data using a computer system having processor, memory, and data storage subsystems, the computer-implemented method comprising:

transforming user input data from a first data structure to a second data structure via one or more intermediate mirror data structures, wherein the second data structure includes at least a first set of leaf nodes under a first ancestor node and a second set of leaf nodes under a second ancestor node;

identifying one or more potential candidate nodes for the first ancestor node via a vote based processing of the processor-based, at least in part, on parent nodes from the first data structure associated with the leaf nodes in the first set;

identifying one or more potential candidate nodes for the second ancestor node via the vote based processing of the processor-based, at least in part, on parent nodes from the first data structure associated with the leaf nodes in the second set;

assigning the first ancestor node based on a selection of the potential candidate node most often identified from the vote based processing as associated with the leaf nodes in the first set, wherein the assigned first ancestor node comprises data preserved and maintained from the first data structure; and

assigning the second ancestor node based on a selection of one or more criteria including the potential candidate node most often identified from the vote based processing as associated with the leaf nodes in the second set, wherein:

said transforming data, said identifying one or more potential candidate nodes for the first ancestor node, said identifying one or more potential candidate nodes for the second ancestor node, said assigning the first ancestor node, and said assigning the second ancestor node are all conducted incrementally as additional user input is received.

14. (Currently Amended) A data processing computer system having processor, memory, and data storage subsystems, the data processing computer system comprising:

a computer-readable storage medium containing user input data representing a first data structure;

a parser, comprising: one or more mirror data structures of the first data structure received by one or more parser analysis engines, wherein the one or more parser analysis engines operate concurrently with the user input to the first data structure; and

a processor programmed and adapted to: (a) transform the user input data in the first data structure to a second data structure via the one or more mirror data structures, wherein the second data structure includes at least a first set of leaf nodes under a first ancestor node and a second set of leaf nodes under a second ancestor node; (b) identify one or more potential candidate nodes for the first ancestor node via a vote based processing of ~~based, at least in part, on~~ ancestor nodes from the first data structure associated with the leaf nodes in the first set; (c) identify one or more potential candidate nodes for the second ancestor node via the vote based processing of the ~~based, at least in part, on~~ ancestor nodes from the first data structure associated with the leaf nodes in the second set; (d) assign the first ancestor node based on a selection of the potential candidate node most often identified from the vote based processing as associated with the leaf nodes in the first set; and (e) assign the second ancestor node based on a selection of one or more criteria including the potential candidate node most often identified from the vote based processing as associated with the leaf nodes in the second set.

18. (Currently Amended) A data processing computer system having processor, memory, and data storage subsystems, the data processing computer system comprising:

a computer-readable medium containing user input data representing a first data structure;

one or more mirror data structures representing the first data structure and sent to a corresponding one or more parser analysis engines, wherein the one or more parser analysis engines operate on the one or more mirror data structures concurrently with the user input data to the first data structure; and

a processor programmed and adapted to: (a) transform data in the first data structure to a second data structure via the one or more mirror data structures, wherein the second data structure includes at least a first set of leaf nodes under a first ancestor node and a second set of leaf nodes under a second ancestor node; (b) identify one or more potential candidate nodes for the first ancestor node based, at least in part, on a bottom-up hierarchical structured selection of ancestor nodes from the first data structure associated with the leaf nodes in the first set; (c) identify one or more potential candidate nodes for the second ancestor node based, at least in part, on a bottom-up hierarchical structured selection of ancestor nodes from the first data structure associated with the leaf nodes in the second set; (d) assign the first ancestor node based on a top-down hierarchical structured selection of the potential candidate node most often identified as associated with the leaf nodes in the first set, wherein the assigned first ancestor node comprises data preserved and maintained from the first data structure; and (e) assign the second ancestor node based on a top-down hierarchical structured selection of one or more criteria other than the potential candidate node most often identified as associated with the leaf nodes in the second set.

Allowance

3. Claims 1-24 are allowed. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Reasons for Allowance

4. The following is an examiner's statement of reasons for allowance: the prior art of record does not render obvious, nor anticipate the combination of claimed elements, including the limitations of "providing a mirror data structure to represent a first data structure...snapshots of the mirror data structure...operating on the snapshots by the plurality of parser analysis engines to form a second data structure" and "assigning the first ancestor node...assigning the second ancestor node..." in accordance with a hierarchical or vote based processing of nodes, as recited in independent claims 1, 6, 14 and 18. Dependent claims 2-5, 7-13, 15-17 and 19-24 are allowed at least by virtue of their dependencies from the independent claims.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Barbara et al (US Pat. No. 5,710,916) discloses a system for determining distance between two handwritten strings in a database that includes a child/leaf node analysis.

Beernick et al (US Pat. No. 5,680,480) discloses a method for training a recognizer that utilizes a tree-node structure for characters.

Jourjine (US Pat. No. 5,991,441) discloses a real-time handwriting recognition system that includes a node-tree analysis section.

Loudon et al (US Pub. No. 2003/0190074 A1) discloses a handwriting recognition system for ideographic characters that include lexical trees.
